

ABSTRACT OF THE DISCLOSURE
SYSTEM AND METHOD FOR INTEGRATING APPLICATIONS IN DIFFERENT
ENTERPRISES SEPARATED BY FIREWALLS

[0031] A system for integrating applications in different enterprises separated by firewalls comprises: an input for receiving high level business data from a source application; an encryption engine for encrypting the business data to produce encrypted business data; a queue manager for receiving the encrypted business data and for storing the business data for delivery to a target application; and an output for transmitting the encrypted business data to the target application, wherein the system and the target application are separated by at least one firewall.
